

## RETINAL IMAGING SYSTEM

### Abstract

5           A retinal imaging system includes a light source and optics which receive light  
from the light source and which transmit the light to produce a beam that is substantially  
convergent. The beam penetrates a lens of an eye and diverges following penetration of  
the lens to illuminate an area of a retina of the eye. An imaging device receives a  
reflection of light from the retina.
